

# SITE SECTIONS

A series of long sight line sections have been taken through the site. These have been produced using a computer generated 3D ground profile model to illustrate objectively how the development relates to adjacent housing in the area and the extent of views from these locations. They illustrate how the development has been harmoniously integrated into the landscape, ensuring that after 5 years of establishment a strong green skyline is achieved. In addition, a combination of advanced infrastructure planting and local topography will help mitigate visual impact to neighbouring properties.
